## 4 Graph algorithms

### 4.1 Fast Dijkstra's algorithm

```
// Implementation of Dijkstra's algorithm using adjacency lists
// and priority queue for efficiency.
// Running time: O(|E| log |V|)
#include <queue>
#include <cstdio>
using namespace std:
const int INF = 20000000000:
typedef pair<int, int> PII;
        int N, s, t;
        scanf("%d%d%d", &N, &s, &t);
        vector<vector<PII> > edges(N);
        for (int i = 0; i < N; i++) {
               int M;
                scanf("%d", &M);
                for (int j = 0; j < M; j++) {
                        int vertex, dist;
                        scanf("%d%d", &vertex, &dist);
                        edges[i].push_back(make_pair(dist, vertex
                              )); // note order of arguments here
        // use priority queue in which top element has the "
              smallest" priority
```

```
priority_queue<PII, vector<PII>, greater<PII> > Q;
        vector<int> dist(N, INF), dad(N, -1);
        Q.push(make_pair(0, s));
        while (!Q.empty()) {
                PII p = Q.top();
                Q.pop();
                int here = p.second;
                if (here == t) break;
                if (dist[here] != p.first) continue;
                 for (vector<PII>::iterator it = edges[here].begin
                       (); it != edges[here].end(); it++) {
                         if (dist[here] + it->first < dist[it->
                               second1) {
                                 dist[it->second] = dist[here] +
                                        it->first;
                                  dad[it->second] = here;
                                 Q.push(make_pair(dist[it->second
                                        ], it->second));
        printf("%d\n", dist[t]);
        if (dist[t] < INF)</pre>
                for (int i = t; i != -1; i = dad[i])
    printf("%d%c", i, (i == s ? '\n' : ' '));
        return 0;
Sample input:
2 1 2 3 1
2 2 4 4 5
3 1 4 3 3 4 1
2 1 5 2 1
Expected:
4 2 3 0
```

## 4.2 Strongly connected components

```
#include < memory.h >
struct edge{int e, nxt;};
edge e[MAXE], er[MAXE];
int sp[MAXV], spr[MAXV];
int group_cnt, group_num[MAXV];
bool v[MAXV];

  // expected output:
       2453089
       3/24/2004
       Wed
  cout << jd << endl
    << m << "/" << d << "/" << y << endl
    << day << end1;
```

#### 6.3 Regular expressions

```
// Code which demonstrates the use of Java's regular expression
       libraries.
// This is a solution for
      Loglan: a logical language
     http://acm.uva.es/p/v1/134.html
// In this problem, we are given a regular language, whose rules
// inferred directly from the code. For each sentence in the
       input, we must
// determine whether the sentence matches the regular expression
       or not. The
// code consists of (1) building the regular expression (which is
        fairly
// complex) and (2) using the regex to match sentences.
import java.util.*;
import java.util.regex.*;
public class LogLan {
    public static String BuildRegex (){
         String space = " +";
         String A = "([aeiou])";
String C = "([a-z&&[^aeiou]])";
        String C = "([a-z&&["aeiou]])
String MOD = "(g" + A + ")";
String BA = "(b" + A + ")";
String DA = "(d" + A + ")";
         String LA = "(1" + A + ")";
         String NAM = "([a-z]*" + C + ")";
String PREDA = "(" + C + C + A + C + A + "|" + C + A + C
                + C + A + ")";
```

```
String predstring = "(" + PREDA + "(" + space + PREDA + "
    String predname = "(" + LA + space + predstring + "|" +
         NAM + ")";
   String preds = "(" + predstring + "(" + space + A + space
   preds + ")";
    String verbpred = "(" + MOD + space + predstring + ")";
   String statement = "(" + predname + space + verbpred + space + predname + "|" +
        predname + space + verbpred + ")";
   String sentence = "(" + statement + "|" + predclaim + ")"
   return "^" + sentence + "$";
public static void main (String args[]) {
   String regex = BuildRegex();
   Pattern pattern = Pattern.compile (regex);
   Scanner s = new Scanner(System.in):
   while (true) {
        // In this problem, each sentence consists of
             multiple lines, where the last
        // line is terminated by a period. The code below
             reads lines until
        // encountering a line whose final character is a
              '.'. Note the use of
             s.length() to get length of string
             s.charAt() to extract characters from a Java
             s.trim() to remove whitespace from the
             beginning and end of Java string
       // Other useful String manipulation methods include
             s.compareTo(t) < 0 if s < t, lexicographically s.indexOf("apple") returns index of first
             occurrence of "apple" in s
             s.lastIndexOf("apple") returns index of last
             occurrence of "apple" in s
             s.replace(c,d) replaces occurrences of
              character c with d
             s.startsWith("apple) returns (s.indexOf("apple
              ") == 0)
             s.toLowerCase() / s.toUpperCase() returns a new
              lower/uppercased string
             Integer.parseInt(s) converts s to an integer
              (32-bit)
             Long.parseLong(s) converts s to a long (64-bit)
             Double.parseDouble(s) converts s to a double
        String sentence = "";
           sentence = (sentence + " " + s.nextLine()).trim()
           if (sentence.equals("#")) return;

```

## 6.5 C++ input/output

```
#include <iostream>
#include <iomanip>
using namespace std;
int main()
{
    // Ouput a specific number of digits past the decimal point,
    // in this case 5
    cout.setf(ios::fixed); cout << setprecision(5);
    cout << 100.0/7.0 << endl;
    cout.unsetf(ios::fixed);

// Output the decimal point and trailing zeros
    cout.setf(ios::showpoint);
    cout << 100.0 << endl;
}</pre>
```

```
cout.unsetf(ios::showpoint);

// Output a '+' before positive values
cout.setf(ios::showpos);
cout << 100 << " " << -100 << endl;
cout.unsetf(ios::showpos);

// Output numerical values in hexadecimal
cout << hex << 100 << " " << 1000 << " " << 10000 << dec << endl;
}</pre>
```

#### 6.6 Knuth-Morris-Pratt

```
Finds all occurrences of the pattern string p within the
text string t. Running time is O(n + m), where n and m
are the lengths of p and t, respecitvely.
#include <iostream>
#include <string>
#include <vector>
using namespace std;
typedef vector<int> VI;
void buildPi(string& p, VI& pi)
  pi = VI(p.length());
  int k = -2;
  for(int i = 0; i < p.length(); i++) {</pre>
    while (k >= -1 &  p[k+1] != p[i])
     k = (k == -1) ? -2 : pi[k];
    pi[i] = ++k;
int KMP (string& t, string& p)
  VI pi;
  buildPi(p, pi);
  int k = -1;
  for(int i = 0; i < t.length(); i++) {</pre>
    while (k \ge -1 \&\& p[k+1] != t[i])
     k = (k == -1) ? -2 : pi[k];
    if(k == p.length() - 1) {
      // p matches t[i-m+1, ..., i]
```

```
cout << "matched at index " << i-k << ": ";
    cout << t.substr(i-k, p.length()) << endl;
    k = (k == -1) ? -2 : pi[k];
}
return 0;
}
int main()
{
    string a = "AABAACAADAABAABA", b = "AABA";
    KMP(a, b); // expected matches at: 0, 9, 12
    return 0;
}</pre>
```

## 6.7 Latitude/longitude

```
Converts from rectangular coordinates to latitude/longitude and
versa. Uses degrees (not radians).
#include <iostream>
#include <cmath>
using namespace std;
struct 11
 double r, lat, lon;
};
struct rect
 double x, y, z;
};
11 convert(rect& P)
 Q.r = sqrt(P.x*P.x+P.y*P.y+P.z*P.z);
 Q.lat = 180/M_PI*asin(P.z/Q.r);
 Q.lon = 180/M_PI*acos(P.x/sqrt(P.x*P.x+P.y*P.y));
rect convert(11& Q)
```

```
rect P;
P.x = Q.r*cos(Q.lon*M_PI/180)*cos(Q.lat*M_PI/180);
P.y = Q.r*sin(Q.lon*M_PI/180)*cos(Q.lat*M_PI/180);
P.z = Q.r*sin(Q.lat*M_PI/180);

return P;
}
int main()
{
    rect A;
    ll B;
    A.x = -1.0; A.y = 2.0; A.z = -3.0;
    B = convert(A);
    cout << B.r << " " << B.lat << " " << B.lon << endl;
    A = convert(B);
    cout << A.x << " " << A.y << " " << A.z << endl;</pre>
```
